# A Brief History of the Development of 2-D Surface Finish Characterization and More Recent Developments in 3-D Surface Finish Characterization 

Harold McCormick \& Kwame Duho C-K Engineering, Inc.

Presented to SME
Society of Manufacturing Engineers
Honing Clinic
24 October 2007

## Cylinder Finish Affects . . .

## Oil Consumption

Scuff/Wear

## Surface Finish Reference Specimens

- Reference by process
- Reference by roughness level

## Effect of Finish on Aerosol Flow

$$
\begin{aligned}
& \mathrm{R}_{\mathrm{VK}}=20.9 \mu \mathrm{in} \\
& \text { Pressure }=30 \text { psig }
\end{aligned}
$$

$\mathrm{R}_{\mathrm{vK}}=45.6 \mu \mathrm{in}$
Pressure $=30$ psig

2-D Finish Parameter Background

- Needed for finish specifications
- 2-D parameters in common use
- Issues with 2-D finish parameters

## 2-D Parameter Development and Country of Origin

## Early

- England
- Germany/Russia
- Japan
- Germany
$\mathbf{R}_{\mathrm{A}}, \mathrm{R}_{\mathrm{Q}}$
$\mathbf{R}_{\mathrm{T}}, \mathbf{R}_{\mathrm{TM}}, \mathbf{R}_{\mathbf{Z}}$
$\mathbf{R}_{\mathrm{SZ}}$ (approximates $\mathrm{R}_{\mathrm{Z}}$ )

Later

$$
\mathrm{R}_{\mathrm{PK}}, \mathrm{R}_{\mathrm{K}}, \mathrm{R}_{\mathrm{VK}}, \mathrm{M}_{2}
$$

These are parameters commonly utilized for cylinder bore finish; more than 100 parameters have been defined and are available for use.

## $\mathbf{R}_{\mathrm{PK}}, \mathbf{R}_{\mathrm{K}}, \mathrm{R}_{\mathrm{VK}}$ Parameter Origin

## Inherent Variations

Means to overcome

- Informal
- Make ten readings
- Discard high/low
- Average remaining eight readings
- Formal - ISO 4288 international standard
- Discard up to $16 \%$ of total readings (readings beyond tolerance limit)

## Measured Values for Two Finishes

## Surface 1

$\mathrm{R}_{\mathrm{a}}-16 \mu \mathrm{in}, \mathrm{R}_{\mathrm{z}}=124 \mu \mathrm{in}, \mathrm{R}_{\mathrm{k}}=50 \mu \mathrm{in}, \mathrm{R}_{\mathrm{pk}}=7 \mu \mathrm{in}, \mathrm{R}_{\mathrm{vk}}=64 \mu \mathrm{in}$
Surface 2

## Why Consider 3-D Parameters . . .

- Improve finish measurement precision an original objective
- Actual result - fewer readings required

3-D Finish Parameter Advantages

- Fewer readings required
- Examines surface area - not a line
- Improves surface finish definition

## Development of 3-D Finish Measurement

- Software
- England
- France
- Germany
- Interferometer
- United States
- Utilization of cylinder bore finish definition
- United States

## Height Parameters Quantify Z Axis Perpendicular to Surface

| ISO 25178 - New 3-D Finish Standard (to be published) |  | Din 4776 - Current Related 2-D Parameters |  |
| :---: | :---: | :---: | :---: |
| $S_{\text {A }}$ | Arithmetical mean height (mean surface roughness) | $\mathrm{R}_{\text {A }}$ | Arithmetical mean of roughness from the mean line |
| $\mathrm{S}_{\mathrm{z}}$ | Maximum height - numerical average between the five deepest valleys and the five highest peaks | $\mathrm{R}_{\mathrm{z}}$ | Numerical average height between the five highest peaks and the five deepest valleys within a sampling length |
| $S_{P}$ | Maximum peak height - height between the mean plane and the highest plane | $\mathrm{R}_{\mathrm{PK}}$ | Reduced peak height that will quickly wear away |
| $S_{V}$ | Maximum valley height - height between the deepest valley and the mean plane | $\mathrm{R}_{\mathrm{VK}}$ | Trough depth - provides oil retaining capability |
| $\mathrm{S}_{\mathrm{K}}$ | Core roughness depth - height difference between intersections points of the found least mean square line | $\mathrm{R}_{\mathrm{K}}$ | Kernel roughness depth - the long-term running surface that will determine the life of the cylinder |

A general relationship exists between 3-D and 2-D finish parameters in the case of height

## 3-D Functional Parameters

| New ISO 25178 <br> Standard | Functional Parameter | Unit | Current DIN <br> Standard |
| :---: | :--- | :---: | :---: |
| $\mathrm{S}_{\mathrm{MR}}$ | Surface bearing area ratio or areal material ratio | $\%$ |  |
| $\mathrm{~S}_{\mathrm{MC}}$ | Height of surface bearing area ratio or inverse <br> areal material ratio | $\mu \mathrm{m}$ | $\mathrm{S}_{\mathrm{bi}}$ |
| $\mathrm{S}_{\mathrm{XP}}$ | Peak extreme height | $\mu \mathrm{m}$ | $\mathrm{S}_{\mathrm{MAX}}$ |
| $\mathrm{V}_{\mathrm{V}}$ | Void volume of the scale limited surface at a <br> given height | $\mu \mathrm{m}^{3} / \mu \mathrm{m}$ |  |
| $\mathrm{V}_{M C}$ | Core material volume of the scale limited <br> surface | $\mu \mathrm{m}^{3} / \mu \mathrm{m}^{2}$ |  |
| $\mathrm{~V}_{\mathrm{VC}}$ | Core void volume of the scale limited surface | $\mu \mathrm{m}^{3} / \mu \mathrm{m}^{2}$ | $\mathrm{~S}_{\mathrm{Ci}}$ |
| $\mathrm{V}_{\mathrm{W}}$ | Valley void volume of the scale limited surface |  | $\mathrm{S}_{\mathrm{Vi}}$ |

- Functional finish values are required in the development of effective models and an understanding of finish on oil consumption and wear
- Functional parameters are calculated from the Abbott-Firestone curve obtained by the integration of the height distribution on the whole surface

## 3-D Bore Surface Finish Data Provides ...

- Surface porosity
- Percent area of surface porosity at location beneath mean core finish
- Distribution of porosity size
- Particles in surface
- Percent area occupied by aluminum particles (in hypereutectic aluminum surfaces) or silicon carbide or other hard particles (in Nikasil ${ }^{\circledR}$-type coatings)
- Particle size distribution - height of particle surface above mean of kernel roughness
- Wear
- At top ring turn-around through $10 \mu$
- At specific location between top and bottom turn-around Wear $\mu \mathrm{m}=\left(\mathrm{S}_{\mathrm{K}}+\mathrm{S}_{\mathrm{PK}}\right)$ before test $-\left(\mathrm{S}_{\mathrm{K}}+\mathrm{S}_{\mathrm{PK}}\right)$ after test

3-D Surface Finish Measurement of Alternative Cylinder Bore Materials

- Hypereutectic aluminum
- Nikasil plating
- Thermally applied coatings

## Available 3-D Finish Measurement Information

 (Alternate Cylinder Bore Surfaces)- 2-D surface image (similar to faxfilm) - torn/folded material, crosshatch angle
- 3-D surface image
- 2-D/3-D height parameters - $\mathrm{S}_{\mathrm{A}} / \mathrm{R}_{\mathrm{A}}, \mathrm{S}_{\mathrm{Z}} / \mathrm{R}_{\mathrm{Z}}, \mathrm{S}_{\mathrm{P}} / \mathrm{R}_{\mathrm{PK}}, \mathrm{S}_{\mathrm{V}} / \mathrm{R}_{\mathrm{VK}}$, $S_{K} / R_{K}$ finish and hard particle height vs. core material
- Functional wear parameters - $\mathrm{S}_{\mathrm{MR}}$ bearing surface area, $\mathrm{S}_{\mathrm{MC}}$ height of surface bearing area
- Functional lubrication/oil consumption parameters - $\mathrm{V}_{\mathrm{v}}$ void volume of scale limited surface at height, $\mathrm{V}_{\mathrm{vc}}$ core void volume of surface
- Additional data - oil consumption, surface porosity, \% area occupied by and size distribution of hard particles

## Typical Hypereutectic Aluminum Cylinder Bore Finish Data

| From Top (mm) | 3-D Parameters from Replicate Scan ( $\mu \mathrm{m}$ ) |  |  |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |

## Typical Cast Iron Cylinder Bore Surface

## Replication Process

Original honed surface

Replicate material is removed from surface producing a negative copy of the surface

2

Primary software produces 2-D image of replicate surface, similar to Fax Film

5 3-D software utilized provides applicable surface data and images

## 3-D Surface Measurement System Major Components

- Replicate material
- Rod for containing replicate material
- Fixture for applying uniform pressure to replicate material and cylinder bore
- Interferometer with well-developed software providing 3-D data for the surface, hard particles (if used in bore material coatings), and surface porosity

## Steps in Making Replicate and Acquiring Data

1. Clean specimen surface with lint free cloth and surface cleaning solution e.g. MEK
2. Apply replicating material into rod by slightly overfilling the slot

3. Use scraper to remove excess material from rod

4. Insert rod into fixture, then insert fixture into cylinder

5. Energize air cylinder with 40 psi opening the valve (flip up) on top of the fixture
6. Let unit set with air pressure for 5 minutes
7. Turn off air valve, separate rod from liner and remove fixture from bore
8. Remove rod from fixture and place under interferometer

9. Make sure image on screen is flat as possible by using tilting knobs in front of holding stage
10. Scan and save image
11. Open SPIP software and bring up saved image
12. Invert image and run plan correction on image
13. Use roughness analysis tool to generate surface parameters in 3-D or 2-D data (using line
profile) profile)
